

Changing the Wheels

The wheels and tires were just entirely inadequate.

The rims were too deep within the wheel wells, especially the rear with the wider body

A combination adapter/spacer was installed on all 4 hubs to allow the different lug pattern rims to be mounted.

The P295-50R15 tires were installed for the back on 10" X 15" rims

The back tires now come nearly all the way out to the fenders. They fill the wheel wells more and are a lot wider under the body.

The front has P245-60R15 tires mounted on 8" X 15" wheels. The simulated spoke baskets are installed to give a more realistic look. Definitely an improvement.
